Precision rehab... for a young, bold smile.

The Starting Point

A 22-year-old patient came to our clinic after years of silently struggling with his smile. He avoided smiling, faced difficulty eating, and would instinctively cover his mouth while yawning.

After visiting 20–25 dentists without finding a clear solution, he finally reached us. All 28 of his teeth were completely flattened—an advanced case of severe tooth wear rarely seen at such a young age.

This case not only challenged our clinical skills but also reminded us how powerful dentistry can be in restoring confidence and function.

Treatment Done

Gum Health : Gum contouring was performed to increase clinical crown height and create more naturally shaped, symmetrical gums for an enhanced overall appearance.

Musculature & TMJ Harmony: The treatment plan ensured that his oral musculature and temporomandibular joint (TMJ) remained in perfect harmony, preventing future complications.

Bite Correction: His bite was carefully raised to restore the lost vertical dimension, which had been severely reduced due to tooth wear. This not only helped recreate a balanced and natural facial profile but also significantly improved his chewing efficiency and overall oral function.

Enhanced Smile Aesthetics: As an added benefit, we focused on improving the smile's aesthetics, achieving both functional and visually pleasing results

Outcome

Patient Talks :

**"I completed my dental treatment in January 2023.
Even with the temporaries,
my confidence changed completely.
After the final restorations, I was even happier –
the shape and shade matched perfectly.
I'm truly satisfied with the result.
Finally,
I can smile...
actually wear a big smile!"**
